

Amendments to the Claims:

- 1 (Previously presented). A projector, comprising:**
 - at least one light source generating a light beam;**
 - at least one optics system disposed in the light beam; and**
 - at least one translucent tape at least partially disposed in the light beam, the tape having at least one red segment, at least one blue segment, and at least one green segment, the segments moving translationally across the light beam to establish a color image, the segments establishing a linear sequence of segments such that the light beam impinges on only one segment at a time..**
- 2 (Original). The projector of Claim 1, wherein the projector is a digital light projector (DLP).**
- 3 (Original). The projector of Claim 1, further comprising a digital mirror device (DMD) disposed in the light path.**
- 4 (Original). The projector of Claim 3, wherein the tape is endless.**
- 5 (Original). The projector of Claim 4, wherein the tape circulates past the DMD.**
- 6 (Original). The projector of Claim 3, further comprising at least one fan disposed in a housing, the housing holding the tape, light source, optics system, and DMD, the tape moving in a plane, the fan exhausting air perpendicular to the plane**
- 7 (Original). The projector of Claim 3, wherein the tape has plural red segments, plural green segments, and plural blue segments, the tape having a flat configuration wherein the tape is rectilinear.**
- 8 (Original). The projector of Claim 1, wherein the tape moves around plural rollers,**

RPS920030243US1

at least one roller being motor driven.

9 (Original). The projector of Claim 3, comprising markers engaged with the tape, each marker being associated with a respective color, the markers being sensed by a sensor.

10 through 16 Canceled

17 (Amended) Apparatus comprising The projector of Claim 16 wherein the tape is endless :

a digital light projector (DLP) having a digital mirror device (DMD) disposed in the projection light path, the DLP generating a demanded image;

a non-rotating, translationally moving endless tape juxtaposed with said DMD for altering the color of a light beam, the tape having at least one red segment, at least one blue segment, and at least one green segment.

18 (Original). The projector of Claim 17, wherein the tape circulates past the DMD.

19 (Original). The projector of Claim 16, further comprising at least one fan disposed in a housing, the housing holding the tape, a light source, an optics system, and the DMD, the tape moving in a plane, the fan exhausting air perpendicular to the plane.

20 through 22 Canceled.
